

# README

## VLC for Android

This is the official **Android** port of [VLC](#).

VLC on Android plays all the same files as the classical version of VLC, and features a media database for Audio and Video files and stream.

## Project Structure

Here are the current folders of vlc-android project:

- extension-api : Application extensions SDK (not released yet)
- application : Android application source code, organized by modules.
- buildsystem : Build scripts, CI and maven publication configuration
- libvlc : LibVLC gradle module, VLC source code will be cloned in vlc/ at root level.
- medialibrary : Medialibrary gradle module

# LibVLC

LibVLC is the Android library embedding VLC engine, which provides a lot of multimedia features, like:

- Play every media file formats, every codec and every streaming protocols
- Hardware and efficient decoding on every platform, up to 8K
- Network browsing for distant filesystems (SMB, FTP, SFTP, NFS...) and servers (UPnP, DLNA)
- Playback of Audio CD, DVD and Bluray with menu navigation
- Support for HDR, including tonemapping for SDR streams
- Audio passthrough with SPDIF and HDMI, including for Audio HD codecs, like DD+, TrueHD or DTS-HD
- Support for video and audio filters
- Support for 360 video and 3D audio playback, including Ambisonics
- Ability to cast and stream to distant renderers, like Chromecast and UPnP renderers.

And more.

You can use our LibVLC module to power your own Android media player. Download the .aar directly from [Maven](#) or build from source.

Have a look at our [sample codes](#).

## License

VLC for Android is licensed under [GPLv2 \(or later\)](#). Android libraries make this, de facto, a GPLv3 application.

VLC engine (*LibVLC*) for Android is licensed under [LGPLv2](#).

## Build

Native libraries are published on bintray. So you can:

- Build the application and get libraries via gradle dependencies (JVM build only)
- Build the whole app (LibVLC + Medialibrary + Application)
- Build LibVLC only, and get an .aar package

## Build Application

VLC-Android build relies on gradle build modes :

- Release & Debug will get LibVLC and Medialibrary from Bintray, and build application source code only.
- SignedRelease also, but it will allow you to sign application apk with a local keystore.
- Dev will build build LibVLC, Medialibrary, and then build the application with these binaries. (via build scripts only)

## Build LibVLC

You will need a recent Linux distribution to build VLC. It should work with Windows 10, and macOS, but there is no official support for this.

## Setup

Check our [AndroidCompile wiki page](#), especially for build dependencies.

Here are the essential points:

On Debian/Ubuntu, install the required dependencies:

```
sudo apt install automake ant autopoint cmake build-essential
libtool-bin \
patch pkg-config protobuf-compiler ragel subversion unzip git
\
openjdk-8-jre openjdk-8-jdk flex python wget
```

Setup the build environment: Set \$ANDROID\_SDK to point to your Android SDK directory export ANDROID\_SDK=/path/to/android-sdk

Set \$ANDROID\_NDK to point to your Android NDK directory export ANDROID\_NDK=/path/to/android-ndk

Then, you are ready to build!

## Build

```
buildsystem/compile.sh -l -a <ABI>
```

ABI can be arm, arm64, x86, x86\_64 or all for a multi-abis build

You can do a library release build with -r argument

## Medialibrary

Build Medialibrary with -ml instead of -l

## Contribute

VLC is a libre and open source project, we welcome all contributions.

Just respect our [Code of Conduct](#), and if you want do contribute to the UI or add a new feature, please open an issue first so there can be a discussion about it.

## Pull requests

Pull requests must be proposed on our [gitlab server](#).

So you must create an account, fork vlc-android project, and propose your merge requests from it.

**Except for translations**, see the section below.

## Translations

You can help improving translations too by joining the [transifex vlc project](#)

Translations merge requests are then generated from transifex work.

## Issues and feature requests

VLC for Android bugtracker is hosted on [VideoLAN gitlab](#)  
Please look for existing issues and provide as much useful details as you can (e.g. vlc app version, device and Android version).

A template is provided, please use it!

Issues without relevant information will be ignored, we cannot help in this case.

## Support

- For usage support, use the in-app feedback option in the About screen
- Android mailing list: [android@videolan.org](mailto:android@videolan.org)
- bugtracker: <https://code.videolan.org/videolan/vlc-android/issues>
- IRC: *#videolan* channel on [libera](#)
- VideoLAN forum: <https://forum.videolan.org/viewforum.php?f=35>
